Topsoil

OBJECT

EXCAVATION EARTH AND ROCKS

Excavation earth and rocks refers to the excavated soil resulting from following activities: **excavations in general** (excavation, foundations, trenches); **drilling, piling, consolidation**; **infrastructural works in general**; This material must be - if not identified as a by-product - managed, transported and disposed of as waste.

SOIL MANAGEMENT

The general principles on which correct soil management on construction sites is based are mainly three:

- 1. valorize the upper (and possibly lower) layer of the removed Topsoil.
- 2. reduce as much as possible the occupied surfaces and the removal of soil (right of way, plants, removal work on excavated or worked surfaces).
- 3. rather than subsequently remediating soil that has not been treated correctly, prevention is easier and cheaper.

OPERATING INSTRUCTIONS

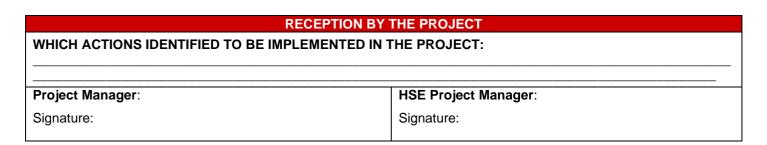

It is recommended to:

- Do not move excavated earth and rocks outside the construction site without the necessary authorization.
- Make sure that the excavated earth and rocks are not contaminated by hazardous substances and/or waste, and if they are, it must be treated as waste.
- Check whether it is possible to reuse them in situ by contacting the project HSE department.
- Carry out excavation activities exclusively in the right of way and/or authorized areas.
- Carry out storage in piles in specifically dedicated storage areas at the production site.
- Avoid transit of construction vehicles and heavy equipment over the deposited material.
- prevent the soil deposit from expanding/sliding onto land not covered by the activity.
- Respect the maximum height of the storage pile.

POSSIBLE CONSEQUENCES:

The possible consequences due to incorrect management of excavated earth and rocks are the following:

- Possible environmental damage.
- Administrative and/or Criminal Sanctions by the relevant Bodies.
- Legal disputes with private individuals and public institutions.
- Customer complaints.
- Damage to the company's public image.
